# PROCHEM Your Source for Local Supply and Support

# Buttweld Pipe Fittings

NOTE: ANSI B16.9, MSS-SP-43

Buttweld fittings in duplex and other special alloys are available from stock and throughout our worldwide network of suppliers. Concentric and eccentric reducers, equal and reducing tees, 45° and 90° elbows, caps and stub ends are all part of the comprehensive range of buttweld fittings carried by Prochem.

Stocks include dual grades 304/304L, 316/316L and 321/321H austenitic stainless steel, as well as other material grades in sizes 15 NB (1/2") to 400 NB (16") in SCH 10S, SCH 40S and SCH 80S. Larger sizes and heavier schedules, such as SCH 160 or XXS, are readily available through our worldwide network.

# Buttweld Fittings

A pipe fitting is defined as a part used in a piping system, to change direction or function, which is mechanically joined to the system.

Probably the simplest way to achieve this would be to bend the pipe in the direction required, but this process will stretch and thin the outer wall whilst thickening and wrinkling the inner wall. This results in flow resistance and accelerated wall erosion.

A second method sometimes used is a mitre joint, where pipes are cut to the correct angle and welded together to achieve the desired change. Whilst the cross-sectional area and wall thickness are maintained, a great deal of efficiency is lost due to friction and turbulence resulting from the severe changes in direction. For example, a single-mitre bend offers about six times the resistance of a swept elbow.

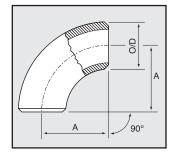

For these reasons swept fittings are preferred on most piping systems, particularly where internal pressure, flow and corrosion are of major consideration.

# TYPES AND APPLICATIONS OF BUTTWELD FITTINGS

A piping system using buttweld fittings has many inherent advantages over other forms.

- Welding a fitting to the pipe means it is permanently leakproof.
- The continuous metal structure formed between pipe and fitting adds strength to the system.
- Smooth inner surface and gradual directional changes reduce pressure losses and turbulence and minimise the action of corrosion and erosion.
- A welded system utilises a minimum of space.

#### 90° ELBOWS

The function of a 90° elbow is to change direction or flow in a piping system.

Elbows are split into three groups which define the distance over which they change direction, expressed as a function of the distance from the centre line of one

end to the opposite face. This is known as the centre to face distance and is equivalent to the radius through which the elbow is bent.

#### **Long Radius Elbow**

The most common is the long radius (LR) elbow where the centre to face dimension is always 1-1/2 times the nominal pipe size of the elbow.

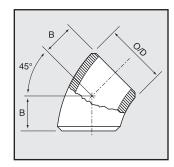

#### **Short Radius Elbow**

In this case the centre to face dimension is the same as the nominal pipe size of the elbow.

#### **Extra Long Radius**

This is where the centre to face dimension is longer than the standard long radius type. The most common of these is where the centre to face dimension is three times the nominal size, i.e. 3D.

#### 45° ELBOWS

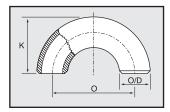

The function of a 45° elbow is the same as a 90° elbow, but the measurement of dimensions, however, is different to that of the 90° elbow. The radius of a 45° elbow is the same as the radius of the 90° LR elbow where 'R' equals 1-1/2 x D. However, the centre to face

dimension is not equivalent to the radius as in 90° LR elbows. This is measured from each face to the point of intersection of the centre lines perpendicular to each other. This is due to the smaller degree of bend.

© PROCHEM PIPELINE PRODUCTS - MAR 2021

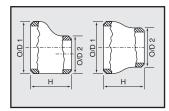

#### 180° RETURN BENDS

The function of a 180° return bend is to change direction of flow through 180° and there are two basic types, long radius and short radius. Both types have a centre to centre dimension double the

matching 90° elbows. The primary application for these fittings is in heater coils and heat exchangers, boilers etc.

# **ECCENTRIC AND CONCENTRIC REDUCERS**

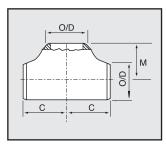

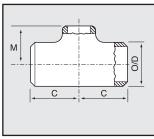

The function of both types of reducer is to reduce the line from a larger to a smaller pipe size, this obviously results in an increased flow pressure. With the eccentric reducer the smaller outlet end is off centre

to the larger end enabling it to line up with one side of the inlet and not with the other.

The concentric reducer is so manufactured that both inlet and outlet ends are on a common centre line. The concentric reducer is easier and less expensive to produce but does not allow quite the same versatility as the eccentric reducer. The lengths of both types are fixed by manufacturing standards.

#### **EQUAL AND REDUCING TEES**

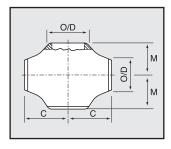

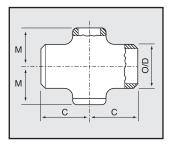

The function of a tee is to permit flow at 90° to the main direction of flow. The main flow passes through the 'run' whilst the 90° outlet is known as the 'branch'. The equal tee is manufactured with all three outlets being the same size.

The reducing tee is manufactured with the branch outlet smaller than the run to obtain the desired flow and pressure through the system.

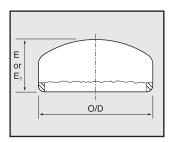

#### **EQUAL AND REDUCING CROSSES**

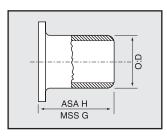

The function of a cross is similar to that of a tee with the exception of providing two 90° outlets opposite each other. Equal crosses have all four outlets of equal size. Reducing crosses have branches that are smaller in size to that of the run to obtain the desired flow and pressure through the system.

#### **CAPS**

The function of an end cap is to block off the end of a line in piping systems. This is achieved by placing the end cap over the open line and welding around the joint.

#### STUB ENDS

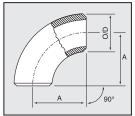

A stub end and its associated slip-on flange allows quick disconnection of the particular section involved as well as easy alignment of mating flanges. Stub ends are installed in pairs and mated together with two slip-on

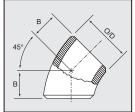

flanges. The surface of the stub end has a phonographic serrated gasket surface which prevents leakage at the joint.

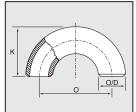

There are two basic types of stub end, ANSI types A & B long barrel, and M.S.S. types short barrel. Under certain design criteria such as temperature or pressure, it is not acceptable to have the joint between stub end and pipe in close proximity with the flange joint, in these applications ANSI types are used.

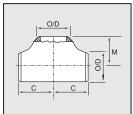

Type A stub ends are used with lap joint flanges. Type B stub ends are used with slip-on flanges.
